

**Listing of Claims:**

This listing of claims will replace all prior versions, and listing, of claims in the application:

Claim 1 (previously presented): An apparatus for identifying a requested level of service for a transaction, comprising:

- computer readable storage media; and
- computer readable program code stored in said storage media, comprising:
  - a) program code for prompting a user to select a requested level of service for said transaction; and
  - b) program code for assigning said requested level of service to said transaction.

Claim 2 (original): An apparatus, as in claim 1, wherein said transaction is a packetized signal comprising at least a data packet, and wherein a service tag is associated with said data packet by said program code for assigning said requested level of service, said service tag including said requested level of service.

Claim 3 (original): An apparatus, as in claim 1, further comprising:

- a) program code for selecting a backup level of service; and
- b) program code for assigning said backup level of service to said transaction.

Claim 4 (original): An apparatus, as in claim 1, wherein said requested level of service is a predefined service category.

Claim 5 (previously presented): An apparatus for identifying a requested level of service for a transaction, comprising:

- computer readable storage media; and
- computer readable program code stored in said storage media, comprising:

- a) program code for selecting said requested level of service for said transaction, said requested level of service being based on a user identification; and
- b) program code for assigning said requested level of service to said transaction.

Claims 6-8 (cancelled)

Claim 9 (previously presented): A method for requesting a level of service for a transaction on a network, comprising:

- selecting said requested level of service for said transaction via a user interface; and
- assigning said requested level of service to said transaction.

Claims 10-13 (cancelled)

Claim 14 (previously presented): An apparatus for routing a transaction over a network based on a requested level of service associated with said transaction, comprising:

- a number of computer readable storage media; and
- computer readable program code stored in said number of storage media, comprising:
  - a) program code for selecting said requested level of service for said transaction;
  - b) program code for assigning a service tag to said transaction, said service tag including said requested level of service, and said program code assigning parts of said service tag at more than one point on said network;
  - c) program code for reading said requested level of service from said service tag; and
  - d) program code for directing said transaction over said network based on said requested level of service read from said service tag.

Claim 15 (original): An apparatus, as in claim 14, wherein said transaction is directed over said network to a device best providing said requested level of service.

Claim 16 (cancelled)

Claim 17 (original): An apparatus, as in claim 14, wherein said service tag is read by program code at more than one point on said network.

Claim 18 (original): An apparatus, as in claim 14, further comprising program code for changing said requested level of service included on said service tag.

Claims 19-20 (cancelled)
